## Losely Oriental Spruce\*

*Picea orientalis* 'Losely'

Height: 4 feet

Spread: 4 feet

Sunlight: ○

Hardiness Zone: 4a

### Description:

A very slow growing rounded evergreen shrub that becomes more conical with age; dark green foliage all year long; very adaptable, an excellent accent choice for the smaller home landscape

### Ornamental Features

Losely Oriental Spruce is a dwarf conifer which is primarily valued in the landscape or garden for its ornamental globe-shaped form. It has attractive dark green evergreen foliage which emerges light green in spring. The needles are highly ornamental and remain dark green throughout the winter.

### Landscape Attributes

Losely Oriental Spruce is a dense multi-stemmed evergreen shrub with a more or less rounded form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a relatively low maintenance shrub. When pruning is necessary, it is recommended to only trim back the new growth of the current season, other than to remove any dieback. It has no significant negative characteristics.

Losely Oriental Spruce is recommended for the following landscape applications;

- Accent
- General Garden Use

### Planting & Growing

Losely Oriental Spruce will grow to be about 4 feet tall at maturity, with a spread of 4 feet. It tends to fill out right to the ground and therefore doesn't necessarily require facer plants in front. It grows at a slow rate, and under ideal conditions can be expected to live for 80 years or more.

---

This shrub should only be grown in full sunlight. It does best in average to evenly moist conditions, but will not tolerate standing water. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution, and will benefit from being planted in a relatively sheltered location. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This is a selected variety of a species not originally from North America.
